

Software Engineering - A4

TP 2: Software Project Requirements & Specification

2025-2026

Objective

The goal of this TP is to apply your knowledge of **management software** by planning and developing a software project. The project will be carried out in teams, following the **Scrum methodology**, and will progressively introduce technical development using **Node.js** and **React** in the second part of the course.

Task 1 – Project Definition

1. Form a group of **3 to 4 students** (5 only in exceptional cases, with justification).
 - To create or join a group, please refer to the Excel file [SE_groups](#).
2. As a team, you are responsible for developing a software application.
3. The **theme/activity** of your project must be validated with the TD instructor (examples: e-commerce website, music library, security application, etc.).

Task 2 – Requirements, Specification & Design Documentation (to be submitted)

For this **first sprint** (until the next TP session), your deliverables will be:

- A **Business Requirements Document (BRD)**
- A **Software Requirements Specification (SRS)**
- A **Software Design Description (SDD)**

Use the Part 2 of the CM and the provided templates **SHMS_BRD**, **SHMS_SRS** and **SHMS_SDD** as a guide for these documents. You can add more details to your documents.

Bonus Deliverables

Additional credit will be offered for the documents:

- **Software Test Documentation (STD)**
- **Validation Plan**

By the end of this sprint, you should have clearly defined:

- **WHY** the software is needed (BRD)
- **WHAT** the system must do (SRS)
- **HOW** it will be designed (SDD)

And optionally, you may also plan HOW it will be **verified** (STD) against specifications and HOW it will be **validated** (Validation Plan) against business needs.

Next Steps

- Subsequent sprints will focus on the **implementation and testing** of your project through Jira
- The **second part of the course** will be dedicated to **hands-on development in Node.js (backend) and React (frontend)**.
